

The city Shibuya is changing dynamically.  
 The amount of the city user, the direction of the traffic circulation are changing by time.  
 People's demand and functional priority to this city is changing as well. This diversity makes Shibuya so attractive.  
 What form of pedestrian platform is the best match for such a condition?  
 Answer would be 'Kinetic structure'  
 But on the other hand, huge structure like a pedestrian bridge needs to be static as a form for its users.  
 We propose a new kinetic pedestrian platform which slowly moves without user's recognition.

# AMOEBA

Kinetic pedestrian platform  
 - Structure which moves without user's recognition -

Form in One Day

Form in One Dusk
